BICYCLO[3.1.0]HEXANE CONTAINING  
OXAZOLIDINONE ANTIBIOTICS AND  
DERIVATIVES THEREOF

CROSS REFERENCE TO RELATED APPLICATIONS

[01] This application claims priority to Provisional Application Serial No. \_\_\_\_\_, filed March 14, 2002, and Provisional Application Serial No. 60/283,956, filed April 17, 2001.

BACKGROUND OF THE INVENTION

[02] Oxazolidinones represent the first new class of antibacterials to be developed since the quinolones. The oxazolidinones are synthetic antibacterial compounds that are orally or intravenously active against problematic multidrug resistant Gram positive organisms and are not cross-resistant with other antibiotics. See Riedl et al, Recent Developments with Oxazolidinone Antibiotics, *Exp. Opin. Ther. Patents* (1999) 9(5), Ford et al., Oxazolidinones: New Antibacterial Agents, *Trends in Microbiology* 196 Vol.5, No. 5, May 1997 and WO 96/35691.

[01] This invention relates to new oxazolidinones having a bicyclic[3.1.0] hexane containing moiety, which are effective against aerobic and anerobic pathogens such as multi-resistant staphylococci, streptococci and enterococci, *Bacteroides* spp., *Clostridia* spp. species, as well as acid-fast organisms such as *Mycobacterium tuberculosis* and other mycobacterial species.

SUMMARY OF THE INVENTION

[02] The present invention relates to compounds of formula I:

its enantiomer, diastereomer, or pharmaceutically acceptable salt, hydrate or prodrug thereof wherein:

[03] A represents C (when — is present), CH, or N (when --- is not present);

[04] — represents a bond;

[05] R represents hydrogen, or C<sub>1-6</sub> alkyl;

[06] R<sub>1</sub> and R<sub>2</sub> independently represent

[07] i) hydrogen,

[08] ii) NR<sub>5</sub>R<sub>6</sub>,

[09] iii) CR<sub>7</sub>R<sub>8</sub>R<sub>9</sub>, C(R)<sub>2</sub>OR<sub>14</sub>, CH<sub>2</sub>NHR<sub>14</sub>,

[010] iv) C(=O)R<sub>13</sub>, C(=NOH)H, C(=NOR<sub>13</sub>)H, C(=NOR<sub>13</sub>)R<sub>13</sub>, C(=NOH)R<sub>13</sub>, C(=O)N(R<sub>13</sub>)<sub>2</sub>, C(=NOH)N(R<sub>13</sub>)<sub>2</sub>, NHC(=X<sub>1</sub>)N(R<sub>13</sub>)<sub>2</sub>, (C=NH)R<sub>7</sub>, N(R<sub>13</sub>)C(=X<sub>1</sub>)N(R<sub>13</sub>)<sub>2</sub>, COOR<sub>13</sub>, SO<sub>2</sub>R<sub>14</sub>, N(R<sub>13</sub>)SO<sub>2</sub>R<sub>14</sub>, N(R<sub>13</sub>)COR<sub>14</sub>, or (C<sub>1-6</sub>alkyl)CN, CN, CH=C(R)<sub>2</sub>, OH, C(=O)CHR<sub>13</sub>, C(=NR<sub>13</sub>)R<sub>13</sub>, NHC(=X<sub>1</sub>)R<sub>13</sub>;

[011]

[012] vi) C<sub>5-10</sub> heterocycle optionally substituted with 1-3 groups of R<sub>7</sub>, which may be attached through either a carbon or a heteroatom;

[013] represents aryl or heteroaryl, heterocycle, heterocyclyl or heterocyclic,

[014]  $R_X$  represents hydrogen or C<sub>1-6</sub> alkyl;

[015]  $R_3$  represent

[016] i)  $NH(C=X_2)R_{12}$ ,

[017] ii)  $NHSO_2R_{14}$ ,

[018] iii)  $NH(CH_2)_{0-4}aryl$ ,

[019] iv)  $NH(CH_2)_{0-4}heteroaryl$ ,

[020] v)  $S(CH_2)_{0-4}aryl$ ,

[021] vi)  $S(CH_2)_{0-4}heteroaryl$ ,

[022] vii)  $O(CH_2)_{0-4}aryl$ , or

[023] viii)  $O(CH_2)_{0-4}heteroaryl$ ;

[024]  $R_4$  and  $R_{4a}$  independently represent

[025] i) hydrogen,

[026] ii) halogen,

[027] iii) C<sub>1-6</sub> alkoxy, or

[028] iv) C<sub>1-6</sub> alkyl

[029]  $r$  and  $s$  independently are 1-3, with the provision that when  $(R_{4a})_s$  and  $(R_4)_r$  are attached to an Ar or HAr ring the sum of  $r$  and  $s$  is less than or equal to 4;

[030]  $R_5$  and  $R_6$  independently represent

[031] i) hydrogen,

[032] ii) C<sub>1-6</sub> alkyl optionally substituted with 1-3 groups of halogen, CN, OH, C<sub>1-6</sub> alkoxy, amino, imino, hydroxyamino, alkoxyamino, C<sub>1-6</sub> acyloxy, C<sub>1-6</sub> alkylsulfenyl, C<sub>1-6</sub> alkylsulfinyl, C<sub>1-6</sub> alkylsulfonyl, aminosulfonyl, C<sub>1-6</sub> alkylaminosulfonyl, C<sub>1-6</sub> dialkylaminosulfonyl, 4-morpholinylsulfonyl, phenyl, pyridine, 5-isoxazolyl, ethylenyloxy, or ethynyl, said phenyl and pyridine optionally substituted with 1-3 halogen, CN, OH, CF<sub>3</sub>, C<sub>1-6</sub> alkyl or C<sub>1-6</sub> alkoxy;

- [033] iii) C<sub>1-6</sub> acyl optionally substituted with 1-3 groups of halogen, OH, SH, C<sub>1-6</sub> alkoxy, naphthalenoxy, phenoxy, amino, C<sub>1-6</sub> acylamino, hydroxylamino, alkoxyamino, C<sub>1-6</sub> acyloxy, aralkyloxy, phenyl, pyridine, C<sub>1-6</sub> alkylcarbonyl, C<sub>1-6</sub> alkylamino, C<sub>1-6</sub> dialkylamino, C<sub>1-6</sub> hydroxyacyloxy, C<sub>1-6</sub> alkylsulfenyl, phthalimido, maleimido, succinimido, said phenoxy, phenyl and pyridine optionally substituted with 1-3 groups of halo, OH, CN, C<sub>1-6</sub> alkoxy, amino, C<sub>1-6</sub> acylamino, CF<sub>3</sub> or C<sub>1-6</sub> alkyl;
- [034] iv) C<sub>1-6</sub> alkylsulfonyl optionally substituted with 1-3 groups of halogen, OH, C<sub>1-6</sub> alkoxy, amino, hydroxylamino, alkoxyamino, C<sub>1-6</sub> acyloxy, or phenyl; said phenyl optionally substituted with 1-3 groups of halo, OH, C<sub>1-6</sub> alkoxy, amino, C<sub>1-6</sub> acylamino, CF<sub>3</sub> or C<sub>1-6</sub> alkyl;
- [035] v) arylsulfonyl optionally substituted with 1-3 of halogen, C<sub>1-6</sub> alkoxy, OH or C<sub>1-6</sub> alkyl;
- [036] vi) C<sub>1-6</sub> alkoxy carbonyl optionally substituted with 1-3 of halogen, OH, C<sub>1-6</sub> alkoxy, C<sub>1-6</sub> acyloxy, or phenyl, said phenyl optionally substituted with 1-3 groups of halo, OH, C<sub>1-6</sub> alkoxy, amino, C<sub>1-6</sub> acylamino, CF<sub>3</sub> or C<sub>1-6</sub> alkyl;
- [037] vii) aminocarbonyl, C<sub>1-6</sub> alkylaminocarbonyl or C<sub>1-6</sub> dialkylaminocarbonyl, said alkyl groups optionally substituted with 1-3 groups of halogen, OH, C<sub>1-6</sub> alkoxy or phenyl
- [038] viii) five to six membered heterocycles optionally substituted with 1-3 groups of halogen, OH, CN, amino, C<sub>1-6</sub> acylamino, C<sub>1-6</sub> alkylsulfonylamino, C<sub>1-6</sub> alkoxy carbonylamino, C<sub>1-6</sub> alkoxy, C<sub>1-6</sub> acyloxy or C<sub>1-6</sub> alkyl, said alkyl optionally substituted with 1-3 groups of halogen, or C<sub>1-6</sub> alkoxy;
- [039] ix) C<sub>3-6</sub> cycloalkylcarbonyl optionally substituted with 1-3 groups of halogen, OH, C<sub>1-6</sub> alkoxy or CN;
- [040] x) benzoyl optionally substituted with 1-3 groups of halogen, OH, C<sub>1-6</sub> alkoxy, C<sub>1-6</sub> alkyl, CF<sub>3</sub>, C<sub>1-6</sub> alkanoyl, amino or C<sub>1-6</sub> acylamino;
- [041] xi) pyrrolylcarbonyl optionally substituted with 1-3 of C<sub>1-6</sub> alkyl;

[042] xii) C<sub>1-2</sub> acyloxyacetyl where the acyl is optionally substituted with amino, C<sub>1-6</sub> alkylamino, C<sub>1-6</sub> dialkylamino, 4-morpholino, 4-aminophenyl, 4-(dialkylamino)phenyl, 4-(glycylamino)phenyl; or

[043] R<sub>5</sub> and R<sub>6</sub> taken together with any intervening atoms can form a 3 to 7 membered heterocyclic ring containing 1-2 heteroatoms independently chosen from O, S, SO, SO<sub>2</sub>, N, or NR<sub>8</sub>;

[044] R<sub>7</sub> represent

[045] i) hydrogen, halogen, OH, C<sub>1-6</sub> alkoxy, C<sub>1-6</sub> alkyl, alkenyl,

[046] ii) amino, C<sub>1-6</sub> alkylamino, C<sub>1-6</sub> dialkylamino, hydroxylamino or C<sub>1-2</sub> alkoxyamino all of which can be optionally substituted on the nitrogen with C<sub>1-6</sub> acyl, C<sub>1-6</sub> alkylsulfonyl or C<sub>1-6</sub> alkoxycarbonyl, said acyl and alkylsulfonyl optionally substituted with 1-2 of halogen or OH;

[047] R<sub>8</sub> and R<sub>9</sub> independently represents

[048] i) H, CN,

[049] ii) C<sub>1-6</sub> alkyl optionally substituted with 1-3 halogen, CN, OH, C<sub>1-6</sub> alkoxy, C<sub>1-6</sub> acyloxy, or amino,

[050] iii) phenyl optionally substituted with 1-3 groups of halogen, OH, C<sub>1-6</sub> alkoxy; or

[051] R<sub>7</sub> and R<sub>8</sub> taken together can form a 3-7 membered ring optionally interrupted with 1-2 heteroatoms chosen from O, S, SO, SO<sub>2</sub>, NH, and NR<sub>8</sub>;

[052] X<sub>1</sub> represents I, S, NR<sub>13</sub>, NCN, or NSO<sub>2</sub>R<sub>14</sub>

[053] X<sub>2</sub> represents O, S, NH or NSO<sub>2</sub>R<sub>14</sub>;

[054] R<sub>10</sub> represents hydrogen, C<sub>1-6</sub> alkyl or CO<sub>2</sub>R<sub>15</sub>;

[055] R<sub>11</sub> represents hydrogen, C<sub>1-6</sub> alkyl, C<sub>1-6</sub> alkanoyl, halogen, amino, C<sub>1-6</sub> acylamino, C<sub>1-6</sub> alkoxy, OH or CF<sub>3</sub>, ; NHC<sub>1-6</sub> alkyl, or N(C<sub>1-6</sub> alkyl)<sub>2</sub>, where said alkyl may be substituted with 1-3 groups of halo, OH or C<sub>1-6</sub> alkoxy;

[056] R<sub>12</sub> represents hydrogen, C<sub>1-6</sub> alkyl, NH<sub>2</sub>, C<sub>1-6</sub> alkylamino, C<sub>1-6</sub> alkoxy or C<sub>1-6</sub> dialkylamino, where said alkyl may be substituted with 1-3 groups of halo, OH or C<sub>1-6</sub> alkoxy;

[057] Each  $R_{13}$  represents independently hydrogen,  $C_{1-6}$  alkyl,  $NR_5R_6$ ,  $SR_8$ ,  $S(O)R_8$ ,  $S(O)2R_8$ , CN,  $C_{1-6}$  alkyl $S(O)R$ ,  $C_{1-6}$  alkoxycarbonyl, hydroxycarbonyl,  $C_{1-6}$  acyl,

[058]  $C_{3-7}$  membered carbon ring optionally interrupted with 1-4 heteroatoms chosen from O, S, SO,  $SO_2$ , NH and  $NR_8$  where said  $C_{1-6}$  alkyl or  $C_{1-6}$  acyl groups may be independently substituted with 0-3 halogens, hydroxy,  $N(R)_2$ ,  $CO_2R$ ,  $C_{6-10}$  aryl,  $C_{5-10}$  heteroaryl, or  $C_{1-6}$  alkoxy groups;

[059] When two  $R_{13}$  groups are attached to the same atom or two adjacent atoms they may be taken together to form a 3-7 membered ring optionally interrupted with 1-2 heteroatoms chosen from O, S, SO,  $SO_2$ , NH, and  $NR_8$ ;

[060]  $R_{14}$  represents amino,  $C_{1-6}$  alkyl,  $C_{1-6}$  haloalkyl, five to six membered heterocycles or phenyl, said phenyl and heterocycles optionally substituted with 1-3 group of halo,  $C_{1-6}$  alkoxy,  $C_{1-6}$  acylamino, or  $C_{1-6}$  alkyl, hydroxy and/or amino, said amino and hydroxy optionally protected with an amino or hydroxy protecting group;

[061]  $R_{15}$  is  $C_{1-6}$  alkyl or benzyl said benzyl optionally substituted with 1-3 groups of halo, OH,  $C_{1-6}$  alkoxy, amino,  $C_{1-6}$  acylamino, or  $C_{1-6}$  alkyl; and

[062] m, n, and q represents 0-1.

[063] Another aspect of the invention is concerned with the use of the novel antibiotic compositions in the treatment of bacterial infections.

#### DETAILED DESCRIPTION OF THE INVENTION

[064] The invention is described herein in detail using the terms defined below unless otherwise specified.

[065] The term "alkyl" refers to a monovalent alkane (hydrocarbon) derived radical containing from 1 to 15 carbon atoms unless otherwise defined. It may be straight or branched. Preferred alkyl groups include lower alkyls which have from 1 to 6 carbon atoms such as methyl, ethyl, propyl, isopropyl, butyl and t-butyl. When substituted, alkyl groups may be substituted with up to 3 substituent groups, selected from the groups as herein defined, at any available point of attachment. When the alkyl group is said to be substituted with an alkyl group, this is used interchangeably with "branched alkyl group".

[066] Cycloalkyl is a species of alkyl containing from 3 to

[067] 15 carbon atoms, without alternating or resonating double bonds between carbon atoms. It may contain from 1 to 4 rings which are fused. Preferred cycloalkyl groups are cyclopropyl, cyclobutyl, cyclopentyl and cyclohexyl. When substituted, cycloalkyl groups may be substituted with up to 3 substituents which are defined herein by the definition of alkyl.

[068] Alkanoyl refers to a group derived from an aliphatic carboxylic acid of 2 to 4 carbon atoms. Examples are acetyl, propionyl, butyryl and the like.

[069] The term "alkoxy" refers to those groups of the designated length in either a straight or branched configuration and if two or more carbon atoms in length, they may include a double or a triple bond. Exemplary of such alkoxy groups are methoxy, ethoxy, propoxy, isopropoxy, butoxy, isobutoxy, tertiary butoxy, pentoxy, isopentoxy, hexoxy, isohexoxy allyloxy, propargyloxy, and the like.

[070] refers to aryl or heteroaryl, heterocycle, Het, heterocyclyl or heterocyclic as described immediately below.

[071] Aryl refers to aromatic rings e.g., phenyl, substituted phenyl and the like, as well as rings which are fused, e.g., naphthyl, phenanthrenyl and the like. An aryl group thus contains at least one ring having at least 6 atoms, with up to five such rings being present, containing up to 22 atoms therein, with alternating (resonating) double bonds between adjacent carbon atoms. The preferred aryl groups are phenyl, naphthyl and phenanthrenyl. Aryl groups may likewise be substituted as defined. Preferred substituted aryls include phenyl and naphthyl.

[072] The term heterocycle, heteroaryl, Het, heterocyclyl or heterocyclic, as used herein except where noted, represents a stable 5- to 7-membered mono- or bicyclic or stable 7- to 10-membered bicyclic heterocyclic ring system, any ring of which may be saturated or unsaturated, and which consists of carbon atoms and from one to three heteroatoms selected from the group consisting of N, O and S, and wherein the nitrogen and sulfur heteroatoms may optionally be oxidized, and the nitrogen heteroatom may optionally be quaternized (in which case it is properly balanced by a counterion), and including any bicyclic group in which any of the above-defined heterocyclic rings is fused to a benzene ring. The heterocyclic ring may be attached at any heteroatom or carbon atom which

results in the creation of a stable structure. The heterocycle, heteroaryl, Het or heterocyclic may be substituted with 1-3 groups of R<sub>7</sub>. Examples of such heterocyclic elements include piperidinyl, piperazinyl, 2-oxopiperazinyl, 2-oxopiperidinyl, 2-oxopyrrolodiny, 2-oxoazepinyl, azepinyl, pyrrolyl, 4-piperidonyl, pyrrolidinyl, pyrazolyl, pyrazolidinyl, imidazolyl, imidazoliny, imidazolidinyl, pyridyl, pyrazinyl, pyrimidinyl, pyrimidonyl, pyridinonyl, pyridazinyl, oxazolyl, oxazolidinyl, isoxazolyl, isoxazolidinyl, morpholinyl, thiazolyl, thiazolidinyl, isothiazolyl, quinuclidinyl, isothiazolidinyl, indolyl, quinolinyl, isoquinolinyl, benzimidazolyl, thiadiazoyl, benzopyranyl, benzothiazolyl, benzoxazolyl, furyl, tetrahydrofuryl, tetrahydropyranyl, thiophenyl, imidazopyridinyl, tetrazolyl, triazinyl, thienyl, benzothienyl, thiamorpholinyl sulfoxide, thiamorpholinyl sulfone, and oxadiazolyl. Additional examples of heteroaryls are illustrated by formulas a, b, c and d:

wherein R<sub>16</sub> and R<sub>17</sub> are independently selected from hydrogen, halogen, C<sub>1-6</sub> alkyl, C<sub>2-4</sub> alkanoyl, C<sub>1-6</sub> alkoxy; and R<sub>18</sub> represents hydrogen, C<sub>1-6</sub> alkyl, C<sub>2-4</sub> alkanoyl, C<sub>1-6</sub> alkoxycarbonyl and carbamoyl.

[073] The term "alkenyl" refers to a hydrocarbon radical straight, branched or cyclic containing from 2 to 10 carbon atoms and at least one carbon to carbon double bond. Preferred alkenyl groups include ethenyl, propenyl, butenyl and cyclohexenyl.

[074] The terms "quaternary nitrogen" and "positive charge" refer to tetravalent, positively charged nitrogen atoms (balanced as needed by a counterion known in the art) including, e.g., the positively charged nitrogen in a tetraalkylammonium group (e. g. tetramethylammonium), heteroarylium, (e.g., N-methyl-pyridinium), basic nitrogens which are protonated at physiological pH, and the like. Cationic groups thus encompass

positively charged nitrogen-containing groups, as well as basic nitrogens which are protonated at physiologic pH.

[075] The term "heteroatom" means O, S or N, selected on an independent basis.

[076] The term "prodrug" refers to compounds which are drug precursors which, following administration and absorption, release the drug in vivo via some metabolic process. Exemplary prodrugs include acyl amides of the amino compounds of this invention such as amides of alkanolic(C<sub>1-6</sub>)acids, amides of aryl acids (e.g., benzoic acid) and alkane(C<sub>1-6</sub>)dioic acids.

[077] Halogen and "halo" refer to bromine, chlorine, fluorine and iodine.

[078] When a group is termed "substituted", unless otherwise indicated, this means that the group contains from 1 to 3 substituents thereon.

[079] When a functional group is termed "protected", this means that the group is in modified form to preclude undesired side reactions at the protected site. Suitable protecting groups for the compounds of the present invention will be recognized from the present application taking into account the level of skill in the art, and with reference to standard textbooks, such as Greene, T. W. et al. Protective Groups in Organic Synthesis Wiley, New York (1991). Examples of suitable protecting groups are contained throughout the specification.

[080] Examples of suitable hydroxyl and amino protecting groups are: trimethylsilyl, triethylsilyl, o-nitrobenzyloxycarbonyl, p-nitrobenzyloxycarbonyl, t-butyldiphenylsilyl, t-butyldimethylsilyl, benzyloxycarbonyl, t-butyloxycarbonyl, 2,2,2-trichloroethyloxycarbonyl, allyloxycarbonyl and the like. Examples of suitable carboxyl protecting groups are benzhydryl, o-nitrobenzyl, p-nitrobenzyl, 2-naphthylmethyl, allyl, 2-chloroallyl, benzyl, 2,2,2-trichloroethyl, trimethylsilyl, t-butyldimethylsilyl, t-butyl diphenylsilyl, 2-(trimethylsilyl)ethyl, phenacyl, p-methoxybenzyl, acetonyl, p-methoxyphenyl, 4-pyridylmethyl, t-butyl and the like.

[081] The bicyclo[3.1.0]hexane containing oxazolidinone compounds of the present invention are useful per se and in their pharmaceutically acceptable salt and ester forms for the treatment of bacterial infections in animal and human subjects. The term "pharmaceutically acceptable ester, salt or hydrate," refers to those salts, esters and hydrated forms of the compounds of the present invention which would be apparent to the

pharmaceutical chemist. i.e., those which are substantially non-toxic and which may favorably affect the pharmacokinetic properties of said compounds, such as palatability, absorption, distribution, metabolism and excretion. Other factors, more practical in nature, which are also important in the selection, are cost of the raw materials, ease of crystallization, yield, stability, solubility, hygroscopicity and flowability of the resulting bulk drug. Conveniently, pharmaceutical compositions may be prepared from the active ingredients in combination with pharmaceutically acceptable carriers. Thus, the present invention is also concerned with pharmaceutical compositions and methods of treating bacterial infections utilizing as an active ingredient the novel bicyclic[3.1.0] hexane containing oxazolidinone compounds.

[082] The pharmaceutically acceptable salts referred to above also include acid addition salts. Thus, the Formula I compounds can be used in the form of salts derived from inorganic or organic acids. Included among such salts are the following: acetate, adipate, alginate, aspartate, benzoate, benzenesulfonate, bisulfate, butyrate, citrate, camphorate, camphorsulfonate, cyclopentanepropionate, digluconate, dodecylsulfate, ethanesulfonate, fumarate, glucoheptanoate, glycerophosphate, hemisulfate, heptanoate, hexanoate, hydrochloride, hydrobromide, hydroiodide, 2-hydroxyethanesulfonate, lactate, maleate, methanesulfonate, 2-naphthalenesulfonate, nicotinate, oxalate, pamoate, pectinate, persulfate, 3-phenylpropionate, picrate, pivalate, propionate, succinate, tartrate, thiocyanate, tosylate and undecanoate.

[083] The pharmaceutically acceptable esters are such as would be readily apparent to a medicinal chemist, and include those which are hydrolyzed under physiological conditions, such as "biolabile esters", pivaloyloxymethyl, acetoxymethyl, phthalidyl, indanyl and methoxymethyl, and others.

[084] Biolabile esters are biologically hydrolizable, and may be suitable for oral administration, due to good absorption through the stomach or intestinal mucosa, resistance to gastric acid degradation and other factors. Examples of biolabile esters include compounds.

[085] An embodiment of this invention is realized when A is CH and all other variables are as described herein.

[086] An embodiment of this invention is realized when A is C and --- is present.

[087] Another embodiment of this invention is realized when A is N and all other variables are as described herein.

[088] Another embodiment of this invention is realized when R<sub>1</sub> and R<sub>2</sub> independently represent H, NR<sub>5</sub>R<sub>6</sub>, CN, OH, C(R)<sub>2</sub>OR<sub>14</sub>, NHC(=X<sub>1</sub>)N(R<sub>13</sub>)<sub>2</sub>, C(=NOH)N(R<sub>13</sub>)<sub>2</sub>, or CR<sub>7</sub>R<sub>8</sub>R<sub>9</sub> and all other variables are as described herein.

[089] Another embodiment of this invention is realized when

[090] is phenyl, pyridine, pyrimidine, or piperidine and all other variables are as described herein.

[091] Another embodiment of this invention is realized when one of R<sub>1</sub> and R<sub>2</sub> is H and the other is NR<sub>5</sub>R<sub>6</sub> and all other variables are as described herein.

[092] Another embodiment of this invention is realized when one of R<sub>1</sub> and R<sub>2</sub> is H and the other is CN and all other variables are as described herein.

[093] Still another embodiment of this invention is realized when R<sub>5</sub> and R<sub>6</sub> independently are:

[094] i) H,

[095] ii) C<sub>1-6</sub> alkyl optionally substituted with 1-3 groups of halogen, CN, OH, C<sub>1-6</sub> alkoxy, amino, hydroxyamino, alkoxyamino, C<sub>1-6</sub> acyloxy, C<sub>1-6</sub> alkylsulfenyl, C<sub>1-6</sub> alkylsulfinyl, C<sub>1-6</sub> alkylsulfonyl, aminosulfonyl, C<sub>1-6</sub> alkylaminosulfonyl, C<sub>1-6</sub> dialkylaminosulfonyl, 4-morpholinylsulfonyl, phenyl, pyridine, 5-isoxazolyl, ethylenyloxy, or ethynyl, said phenyl and pyridine optionally substituted with 1-3 halogen, CN, OH, CF<sub>3</sub>, C<sub>1-6</sub> alkyl or C<sub>1-6</sub> alkoxy;

[096] iii) C<sub>1-6</sub> acyl optionally substituted with 1-3 groups of halogen, OH, SH, C<sub>1-6</sub> alkoxy, naphthalenoxy, phenoxy, amino, C<sub>1-6</sub> acylamino, hydroxylamino, alkoxyamino, C<sub>1-6</sub> acyloxy, phenyl, pyridine, C<sub>1-6</sub> alkylcarbonyl, C<sub>1-6</sub> alkylamino, C<sub>1-6</sub> dialkylamino, C<sub>1-6</sub> hydroxyacyloxy, C<sub>1-6</sub> alkylsulfenyl, phthalimido, maleimido, succinimido, said phenoxy, phenyl and pyridine

optionally substituted with 1-3 groups of halo, OH, CN, C<sub>1-6</sub> alkoxy, amino, C<sub>1-6</sub> acylamino, CF<sub>3</sub> or C<sub>1-6</sub> alkyl; or

[097] iv) benzoyl optionally substituted with 1-3 groups of halogen, OH, C<sub>1-6</sub> alkoxy, C<sub>1-6</sub> alkyl, CF<sub>3</sub>, C<sub>1-6</sub> alkanoyl, amino or C<sub>1-6</sub> acylamino and all other variables are as described herein.

[098] Yet another embodiment of this invention is realized when X<sub>1</sub> represents O and all other variables are as described herein.

[099] Another embodiment of this invention is realized when one of R<sub>1</sub> or R<sub>2</sub> is hydrogen and the other is:

wherein R<sub>10</sub>, X<sub>1</sub>, m, q, and R<sub>11</sub> are described herein.

[0100] A preferred embodiment of this invention is realized when the structural formula is II:

Formula II

[0101] wherein R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub>, R<sub>4a</sub>, and Rx are as described herein and A is N.

[0102] An embodiment of this invention is realized when A is C and --- is present.

[0103] Another preferred embodiment of this invention is realized when the structural formula is IIIa, or IIIb,:

wherein  $R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$ ,  $R_{4a}$ , and  $R_x$  are as described herein and  $A$  is  $N$ .

[0104] An embodiment of this invention is realized when  $A$  is  $C$  and --- is present.

[0105] Preferred compounds of this invention are:

[0233] Suitable subjects for the administration of the formulation of the present invention include mammals, primates, man, and other animals. *In vitro* antibacterial activity is predictive of *in vivo* activity when the compositions are administered to a mammal infected with a susceptible bacterial organism.

[0234] Using standard susceptibility tests, the compositions of the invention are determined to be active against MRSA and enterococcal infections.

[0235] The compounds of the invention are formulated in pharmaceutical compositions by combining the compounds with a pharmaceutically acceptable carrier. Examples of such carriers are set forth below.

[0236] The compounds may be employed in powder or crystalline form, in liquid solution, or in suspension. They may be administered by a variety of means; those of principal interest include: topically, orally and parenterally by injection (intravenously or intramuscularly).

[0237] Compositions for injection, a preferred route of delivery, may be prepared in unit dosage form in ampules, or in multidose containers. The injectable compositions may take such forms as suspensions, solutions, or emulsions in oily or aqueous vehicles, and may contain various formulating agents. Alternatively, the active ingredient may be in powder (lyophilized or non-lyophilized) form for reconstitution at the time of delivery with a suitable vehicle, such as sterile water. In injectable compositions, the carrier is typically comprised of sterile water, saline or another injectable liquid, e.g., peanut oil for intramuscular injections. Also, various buffering agents, preservatives and the like can be included.

[0238] Topical applications may be formulated in carriers such as hydrophobic or hydrophilic bases to form ointments, creams, lotions, in aqueous, oleaginous or alcoholic liquids to form paints or in dry diluents to form powders.

[0239] Oral compositions may take such forms as tablets, capsules, oral suspensions and oral solutions. The oral compositions may utilize carriers such as conventional formulating agents, and may include sustained release properties as well as rapid delivery forms.

[0240] The dosage to be administered depends to a large extent upon the condition and size of the subject being treated, the route and frequency of administration, the sensitivity of the pathogen to the particular compound selected, the virulence of the infection and other factors. Such matters, however, are left to the routine discretion of the physician according to principles of treatment well known in the antibacterial arts. Another factor influencing the precise dosage regimen, apart from the nature of the infection and peculiar identity of the individual being treated, is the molecular weight of the compound.

[0241] The novel antibiotic compositions of this invention for human delivery per unit dosage, whether liquid or solid, comprise from about 0.01% to as high as about 99% of

the bicyclo[3.1.0]hexane discussed herein, the preferred range being from about 10-60% and from about 1% to about 99.99% of one or more of other antibiotics such as those discussed herein, preferably from about 40% to about 90%. The composition will generally contain from about 125 mg to about 3.0 g of the bicyclo[3.1.0]hexane discussed herein; however, in general, it is preferable to employ dosage amounts in the range of from about 250 mg to 1000 mg and from about 200mg to about 5 g of the other antibiotics discussed herein; preferably from about 250 mg to about 1000 mg. In parenteral administration, the unit dosage will typically include the pure compound in sterile water solution or in the form of a soluble powder intended for solution, which can be adjusted to neutral pH and isotonic.

[0242] The invention described herein also includes a method of treating a bacterial infection in a mammal in need of such treatment comprising administering to said mammal the claimed composition in an amount effective to treat said infection.

[0243] The preferred methods of administration of the claimed compositions include oral and parenteral, e.g., i.v. infusion, i.v. bolus and i.m. injection formulated so that a unit dosage comprises a therapeutically effective amount of each active component or some submultiple thereof.

[0244] For adults, about 5-50 mg/kg of body weight, preferably about 250 mg to about 1000 mg per person of the bicyclo[3.1.0]hexane antibacterial compound and about 250 mg, to about 1000 mg per person of the other antibiotic(s) given one to four times daily is preferred. More specifically, for mild infections a dose of about 250 mg two or three times daily of the bicyclo[3.1.0]hexane antibacterial compound and about 250 mg two or three times daily of the other antibiotic is recommended. For moderate infections against highly susceptible gram positive organisms a dose of about 500 mg each of the bicyclo[3.1.0]hexane and the other antibiotics, three or four times daily is recommended. For severe, life-threatening infections against organisms at the upper limits of sensitivity to the antibiotic, a dose of about 500-2000 mg each of the bicyclo[3.1.0]hexane and the other antibiotics, three to four times daily may be recommended.

[0245] For children, a dose of about 5-25 mg/kg of body weight given 2, 3, or 4 times per day is preferred; a dose of 10 mg/kg is typically recommended.

[0246] The compounds of the present invention can be prepared according to the procedures of the following schemes and examples, using appropriate materials, and are

further exemplified by the following specific examples. The compounds illustrated in the examples are not, however, to be construed as forming the only genus that is considered as the invention. The following examples further illustrate details for the preparation of compounds of the present invention. Those skilled in the art will readily understand that known variations of the conditions and processes of the following preparative procedures can be used to prepare the compounds of the present invention. All temperatures are in degrees Celsius unless otherwise noted.

[0247] The compounds of the present invention are prepared according to the Schemes I-VI. In the Schemes that follow X is used to denote an appropriate leaving group and as such may vary in nature depending on the exact reaction conditions employed. Some typical leaving groups may be fluoro, chloro, bromo, iodo, tosyl, mesyl, trifluoromethanesulfonate etc. but these should not be construed as limiting as many leaving groups are well known to those skilled in the art. Scheme I describes the preparation of compounds of the invention in which A is a nitrogen atom and the 3-azabicyclo[3.1.0]hexane has a 6 amino substituent. In step 1 of scheme I a 6-amino-3-azabicyclo[3.1.0]hexane in which the 6-amino substituent is appropriately protected with the protecting groups P and P' is allowed to react with an aryl or appropriate heteroaryl compound bearing a nitro group and a leaving group in the presence or absence of a solvent. Appropriate protecting groups are well known to those skilled in the art and may include but are not limited to such groups as t-butoxycarbonyl, benzyloxycarbonyl or easily removed alkyl substituents such as the benzyl substituent. Examples of appropriate aryl and heteroaryl reaction partners may include, but are not limited to, 3,4-difluoronitrobenzene, 4-fluoronitrobenzene, or 2-nitro-5-fluoropyridine. Examples of appropriate solvents that may be employed are acetonitrile, tetrahydrofuran, methylene chloride, dichloroethane, toluene, dichlorobenzene, or other such solvents well known to those skilled in the art. The reaction is allowed to proceed at an appropriate temperature, which, depending on the solvent may be between 0°C and 150°C until such time that the reaction is determined to be complete. The product is then isolated and may or may not be further purified at the pleasure of the investigator and carried on to step 2.

### Scheme I

[0248] The nitroaryl or heteroaryl compound obtained in step 1 is reduced to the corresponding amino compound in step 2. This transformation may be accomplished by a variety of reducing agents familiar to those skilled in the art such as hydrogenation over an appropriate catalyst such as palladium, platinum, or ruthenium on activated carbon or by chemical methods such reaction  $\text{FeCl}_3$ ,  $\text{SnCl}_2$ , or  $\text{ZnCl}_2$ . The resulting amine is then protected with an appropriate protecting group,  $\text{P}''$ , such as benzyloxycarbonyl or t-butoxycarbonyl. The resulting protected aryl or heteroaryl amines are then isolated and carried on to step 3.

[0249] In step 3 the protected aryl or heteroaryl amine obtained as the product of step 2 is further reacted with a strong base such as n-butyl lithium or t-butyl lithium to form an anionic species which is then condensed with a glycidyl ester to form the 5-hydroxymethyloxazolidinone which is the product of step 3. It should be realized that reaction with a racemic glycidyl ester will result in the preparation of a racemic 5-hydroxymethyloxazolidinone while reaction with a chiral glycidyl ester will result in a chiral oxazolidinone. If an R-glycidylester is employed, the product will be an R-5-hydroxymethyloxazolidinone and likewise if an S-glycidylester is employed the product will be an S-5-hydroxymethyloxazolidinone. Step 3 is conducted in a suitable solvent such as ether or tetrahydrofuran and is generally conducted at a temperature between  $-100^\circ\text{C}$  and  $50^\circ\text{C}$  for a time necessary for complete reaction to occur. In a preferred embodiment of this reaction a solution of n-butyl lithium is added to a solution of the aryl or heteroaryl amine at  $-78^\circ\text{C}$ , then the glycidyl ester is added and the resulting mixture allowed to warm to room temperature until the reaction is judged to be complete. The product is then isolated from the reaction mixture by standard techniques and, if necessary, the product may be purified.

[0250] In step 4 of Scheme I, the 5-hydroxymethyloxazolidinone is converted to a 5-aminomethyloxazolidinone in a three step process. First the hydroxy group is activated by conversion to a leaving group, X. This is generally accomplished by acylation with acylating agents such as methanesulfonyl chloride, p-toluenesulfonyl chloride or the like, generally with the addition of a hindered base such as triethylamine, diisopropylethyl amine or the like to scavenge the acid produced in the reaction. Alternatively, if the nature of X is chosen to be a halide such as a bromide or iodide then reagents such as

phosphorous tribromide, triphenylphosphonium dibromide or triphenylphosphonium diiodide may be chosen. Suitable solvents include but are not limited to ether, acetonitrile, tetrahydrofuran, chlorinated hydrocarbons such as methylene chloride or dichloroethane, pyridine, collidine, or dioxane. In a second step the leaving group is displaced with sodium azide in a suitable solvent such as dimethylformamide, dimethylsulfoxide, or tetramethylurea, tetrahydrofuran and the like at a temperature between 0°C and 100°C. When the reaction is judged to be complete the product is isolated and the resulting 5-azidooxazolidinone is reduced to the amine. A number of methods for the reduction of azides to amines may be used including hydrogenation over an appropriate catalyst such as palladium or platinum, particularly deactivated catalysts such as Lindlar's catalyst (palladium on CaCO<sub>3</sub> deactivated with PbO), or other reducing agents may be employed such as triphenylphosphine or SnCl<sub>2</sub>. The particular method chosen for this reduction is readily made by one of ordinary skill in the art and is dependent upon the structure of the entirety of the molecule.

[0251] In step 5 the 5-amino oxazolidinone is acylated and converted to R<sub>3</sub>. It is recognized that the exact nature of the reagents used for this conversion is dependent is dependent on the exact nature of the R<sub>3</sub> desired. For example if R<sub>3</sub> is desired to be an acetamine group a suitable reagents for performing the acylation would be acetic anhydride, acetyl chloride or the like. However if R<sub>3</sub> is desired to be a thioacetamine group ethyldithioacetate may be an appropriate acylating agent, while 1,1'-thiocarbonyldi-2(1H)-pyridone followed by treatment of the resulting intermediate with aqueous ammonia might be an appropriate procedure if thioureido group was desired for R<sub>3</sub>. The appropriate conditions and reagents for any particular R<sub>3</sub> group will be readily identified by those of ordinary skill in the art.

[0252] Further elaboration of the compounds of the present invention prepared in Scheme I may be carried out by the methods shown in Scheme II. In this case in step 1-4 the amino protecting groups, P and P' may be removed together or sequentially by procedures which will be familiar to those skilled in the art for the particular P and P' to be removed. In certain cases a protecting group P may also be present in the compound of the present invention. For example in the case where P is benzyl and P' is t-butoxycarbonyl simple removal of P' by treatment with an appropriate acid such as trifluoroacetic acid or

hydrochloric acid in a suitable solvent such as methanol or methylene chloride will result in a compound in which P' is removed and P is retained. As shown in step 5, in some cases the compound in which P is retained may be further modified by means of reductive alkylation, alkylation, or acylation to form compounds, which are also of the present invention and incorporate an R<sub>5</sub> as described in the specification. Those skilled in the art will recognize that there are a variety of reagents and reaction conditions available for performing this chemical transformation which include, but are not limited to, the treatment of the product of step 2 with aldehydes, such as formaldehyde, and a reducing agent such as sodium cyanoborohydride, treatment with acylating agents such as anhydrides, acid chlorides, isocyanates, iminoethers, isothiuronium salts, sulfonyl halides, or treatment with alkylating agents such as alkyl iodides, bromides, triflates, or mesylates. Some specific examples of detailed reagents and reaction conditions for carrying out step 5 are detailed in the examples but these should not be construed as limiting for the preparation of compounds of current invention.

## Scheme II

[0253] In a similar manner step 6 exemplifies the further modification compounds in which both of the protecting group, P and P', have been removed. Those skilled in the art will recognize that there are a variety of reagents and reaction conditions available for performing this chemical transformation which include, but are not limited to, the treatment of the completely deprotected product of step 3 or 4 with aldehydes, such as formaldehyde, and a reducing agent such as sodium cyanoborohydride, treatment with acylating agents such as anhydrides, acid chlorides, isocyanates, iminoethers, isothiuronium salts, sulfonyl halides, or treatment with alkylating agents such as alkyl iodides, bromides, triflates, or mesylates. Some specific examples of detailed reagents and reaction conditions for carrying out step 6 are detailed in the examples but these should not be construed as limiting for the preparation of compounds of current invention.

[0254] As can be seen for step 7, the product of step 5 may be further modified by removal of the protecting group P to afford the same products as those obtained by step 6. It is recognized that the exact conditions for the removal of P will depend on the exact nature of P but these procedures are well known and can be easily determined by those of ordinary skill in the art.

[0255] Step 8 exemplifies the procedures employed for the incorporation of R<sub>6</sub>, which is structurally independent from that of R<sub>5</sub>. As shown in step 8, the product of step 6 or 7 may be further modified by alkylation or acylation. Those skilled in the art will recognize that there are a variety of reagents and reaction conditions available for performing this chemical transformation which include, but are not limited to, the treatment of the product of step 6 or 7 with aldehydes, such as formaldehyde, and a reducing agent such as sodium cyanoborohydride, treatment with acylating agents such as anhydrides, acid chlorides, isocyanates, iminoethers, isothiuronium salts, sulfonyl halides, or treatment with alkylating agents such as alkyl iodides, bromides, triflates, or mesylates. Some specific examples of detailed reagents and reaction conditions for carrying out step 8 are detailed in the examples but these should not be construed as limiting for the preparation of compounds of current invention.

[0256] Scheme III describes the preparation of compounds of the invention in which A is a nitrogen atom and the 3-azabicyclo[3.1.0]hexane has a 6 carbon substituent. The synthetic sequence is similar to that described in Scheme I except that P''' is a protecting

group suitable for the protection of an hydroxyl group or is an alkyl group. Examples of appropriate P''' include, but are not limited to alkyl groups, such as methyl, aralkyl groups such as benzyl or p-methoxybenzyl, silyl groups such as t-butyldiphenylsilyl, t-butyldimethylsilyl and the like, or ether groups such as tetrahydropyranyl or methoxymethyl. In step 1 of scheme III a 3-azabicyclo[3.1.0]hexane in which the 6-alkyl substituent is appropriately protected with the protecting groups P''' is allowed to react with an aryl or appropriate heteroaryl compound bearing a nitro group and a leaving group in the presence or absence of a solvent. Examples of appropriate aryl and heteroaryl reaction partners may include, but are not limited to, 3,4-difluoro-nitrobenzene, 4-fluoronitrobenzene, or 2-nitro-5-fluoropyridine. Examples of appropriate solvents that may be employed are acetonitrile, tetrahydrofuran, methylene chloride, dichloroethane, toluene, dichlorobenzene, or other such solvents well known to those skilled in the art. The reaction is allowed to proceed at an appropriate temperature, which, depending on the solvent may be between 0°C and 150°C until such time that the reaction is determined to be complete. The product is then isolated and may or may not be further purified at the pleasure of the investigator and carried on to step 2.

## Scheme III

[0257] The nitroaryl or heteroaryl compound obtained in step 1 is reduced to the corresponding amino compound in step 2. This transformation may be accomplished by a variety of reducing agents familiar to those skilled in the art such as hydrogenation over an appropriate catalyst such as palladium, platinum, or ruthenium on activated carbon or by chemical methods such reaction  $\text{FeCl}_3$ ,  $\text{SnCl}_2$ , or  $\text{ZnCl}_2$ . The resulting amine is then protected with an appropriate protecting group,  $\text{P}''$ , such as benzyloxycarbonyl or t-butoxycarbonyl. The resulting protected aryl or heteroaryl amines are then isolated and carried on to step 3.

[0258] In step 3 the protected aryl or heteroaryl amine obtained as the product of step 2 is further reacted with a strong base such as n-butyl lithium or t-butyl lithium to form an anionic species which is then condensed with a glycidyl ester to form the 5-hydroxymethyloxazolidinone which is the product of step 3. It should be realized that reaction with a racemic glycidyl ester will result in the preparation of a racemic 5-hydroxymethyloxazolidinone while reaction with a chiral glycidyl ester will result in a chiral oxazolidinone. If an R-glycidylester is employed, the product will be an S-5-hydroxymethyloxazolidinone and likewise if an S-glycidylester is employed the product will be an R-5-hydroxymethyloxazolidinone. Step 3 is conducted in a suitable solvent such as ether or tetrahydrofuran and is generally conducted at a temperature between  $-100^\circ\text{C}$  and  $50^\circ\text{C}$  for a time necessary for complete reaction to occur. In a preferred embodiment of this reaction a solution of n-butyl lithium is added to a solution of the aryl or heteroaryl amine at  $-78^\circ\text{C}$ , then the glycidyl ester is added and the resulting mixture allowed to warm to room temperature until the reaction is judged to be complete. The product is then isolated from the reaction mixture by standard techniques and, if necessary, the product may be purified.

[0259] In step 4 of Scheme I, the 5-hydroxymethyloxazolidinone is converted to a 5-aminomethyloxazolidinone in a three step process. First the hydroxy group is activated by conversion to a leaving group, X. This is generally accomplished by acylation with acylating agents such as methanesulfonyl chloride, p-toluenesulfonyl chloride or the like, generally with the addition of a hindered base such as triethylamine, diisopropylethylamine or the like to scavenge the acid produced in the reaction. Suitable solvents include but are not limited to ether, tetrahydrofuran, chlorinated hydrocarbons such as methylene

chloride or dichloroethane, pyridine, collidine, or dioxane. In a second step the leaving group is displaced with sodium azide in a suitable solvent such as dimethylformamide, dimethylsulfoxide, tetramethylurea, or tetrahydrofuran and the like at a temperature between 0°C and 100°C. When the reaction is judged to be complete the product is isolated and the resulting 5-azidooxazolidinone is reduced to the amine. A number of methods for the reduction of azides to amines may be used including hydrogenation over an appropriate catalyst such as palladium or platinum, particularly deactivated catalysts such as Lindlar's catalyst (palladium on  $\text{CaCO}_3$  deactivated with  $\text{PbO}$ ), or other reducing agents may be employed such as triphenylphosphine or  $\text{SnCl}_2$ . The particular method chosen for this reduction is readily made by one of ordinary skill in the art as is dependent upon the structure of the entirety of the molecule.

[0260] In step 5 the 5-aminooxazolidinone is acylated and converted to  $\text{R}_3$ . It is recognized that the exact nature of the reagents used for this conversion is dependent is dependent on the exact nature of the  $\text{R}_3$  desired. For example if  $\text{R}_3$  is desired to be an acetylamine group a suitable reagents for performing the acylation would be acetic anhydride, acetyl chloride or the like. However if  $\text{R}_3$  is desired to be a thioacetylamine group ethyldithioacetate may be an appropriate acylating agent, while 1,1'-thiocarbonyldi-2(1H)-pyridone followed by treatment of the resulting intermediate with aqueous ammonia might be an appropriate procedure if thioureido group was desired for  $\text{R}_3$ . The appropriate conditions and reagents for any particular  $\text{R}_3$  group will be readily identified by those of ordinary skill in the art.

## Scheme IV

[0261] Scheme IV describes the further modification of compound prepared in Scheme III. It is recognized that in many cases the product of step 5 from Scheme III is in and of itself a compound of the current invention. This may particularly be true when P''' is an alkyl or aralkyl group. However, in other cases further chemical modification of the product of step 5 from Scheme III may be desirable. A general method for these chemical modifications is exemplified in Scheme IV. In step 1 the protecting group P''' is removed to reveal the free hydroxymethyl group for further manipulation. It is recognized that the precise reaction conditions for step 1 will be dependent on the structure of the molecule in its entirety in general and on the particular structural nature of the precise P''' to be removed. Such reaction conditions are readily determined by those of ordinary skill in the art. Step 2 exemplifies the direct activation and displacement of the hydroxy group by substituents with a hydroxy group. This transformation is typically performed by the in situ activation of the hydroxy towards displacement with an azodicarboxylate ester such as diethyl azodicarboxylate or diisopropylazodicarboxylate, in the presence of a phosphine such as triphenylphosphine in an aprotic solvent such as tetrahydrofuran. However a more general way of activating the hydroxyl towards displacement with a wide variety of potential nucleophiles is exemplified in step 3 and involves the modification of the hydroxy group to a leaving group, X. It will be recognized by those skilled in the art that the particular conditions and reagents employed will be dependent on the particular group X. This is generally accomplished by acylation with acylating agents such as methanesulfonyl chloride, p-toluenesulfonyl chloride or the like, generally with the addition of a hindered base such as triethylamine, diisopropylethyl amine or the like to scavenge the acid produced in the reaction. Alternatively, if the nature of X is chosen to be a halide such as a bromide or iodide then reagents such as phosphorous tribromide, triphenylphosphonium dibromide, carbon tetrabromide and triphenyl phosphine, or triphenylphosphonium diiodide may be chosen. Suitable solvents include but are not limited to ether, acetonitrile, tetrahydrofuran, chlorinated hydrocarbons such as methylene chloride or dichloroethane, pyridine, collidine, or dioxane.

[0262] Step 4 exemplifies the procedure for the conversion of the product of step 3 to compounds of the instant invention containing an R<sub>7</sub> substituent. It is to be recognized that the leaving groups as defined by X above form a subset of the substructures

represented in R<sub>7</sub> and as such are incorporated into the current invention. It is the further modification of these intermediates that is described in step 4. The reaction conditions required for the introduction of R<sub>7</sub> will vary depending on the exact nature of the R<sub>7</sub> employed as will be readily recognized by one of ordinary skill in the art but generally involve the reaction of a nucleophile in the appropriate solvent with the product of step 3 containing a leaving group X at a temperature between -78°C and 150°C sufficient for the reaction to proceed at the desired rate. When the reaction is judged to be complete the product of step 4 is isolated using conditions well known to those skilled in the art. Some representative nucleophiles that may be used to further exemplify, but not limit, step 4 include carbon nucleophiles, such as cyanide, enolate anions, or organometallic anions, nitrogen nucleophiles, such as amines, imide anions, and nitrogen containing heteroaryl compounds, oxygen nucleophiles, such as alkoxides or hydroperoxides, or sulfur nucleophiles such as thiolates.

[0263] In step 5 of Scheme 4, the hydroxymethyl compound is oxidized to the corresponding aldehyde. A plethora of reagents is available to those skilled in the art for performing this transformation. Among these are chromium based reagents such as chromium trioxide and complexes of chromium trioxide with pyridine in solvents such as pyridine or methylene chloride, cerium ammonium nitrate, N-chlorosuccinimide, dimethylsulfoxide and activating agents such as oxalyl chloride or dicyclohexylcarbodiimide, and 1-hydroxy-1,2-benziodoxol-2(1H)-one 1-oxide in dimethylsulfoxide.

[0264] In step 6 the aldehyde prepared in step 5 is further oxidized to the acid under conditions well known to those skilled in the art. A preferred reagent for performing this transformation is silver oxide although a variety of oxidizing agents such as peracids, including m-chloroperoxybenzoic acid, peracetic acid and trifluoroperoxyacetic acid, chromic acid, or bromine may be considered as non-limiting alternatives.

[0265] In step 7 the carboxylic acid produced as the product of step 6 can be further modified. Typically this may be done by converting the hydroxyl of the carboxylic acid to a leaving group. Although it is readily recognized that many potential leaving groups can be considered and are well known to those of only ordinary skill in the art, some preferred methods include conversion of the carboxylic acid to the acid chloride by

treatment with thionyl chloride or oxalyl chloride, formation of a mixed anhydride by treatment with a dehydrating agent such dicyclohexylcarbodiimide followed by a 2,2-dimethylpropionic acid, or formation of an active ester by treatment with a dehydrating agent such as dicyclohexylcarbodiimide and N-hydroxysuccinimide or pentfluorophenol. The resulting activated carboxylic acid may then be treated with a nucleophile, either in situ or after intermediate isolation of the activated carboxylic acid, to produce the molecules of the instant invention. Typical solvents for this transformation are well known and include methylene chloride, chloroform, carbon tetrachloride, ethers such as tetrahydrofuran, dioxane, and diethyl ether, ethyl acetate and other esters. Typical nucleophiles include alcohols to form esters, primary or secondary amines or ammonia to form amides, and carbon nucleophiles such as organometallic species to afford ketones and tertiary carbinol derivatives.

[0266] The preparation of the compounds of the present invention where A contains a carbon atom is shown in Schemes V-VI. In step 1 of Scheme V an appropriately protected 3-trifluoromethansulfonyl-6-amino-bicyclo[3.1.0]hexene is reacted with a suitably substituted 2-oxo-3-(4-trimethylstannylphenyl)-5-substituted oxazolidinone in the presence of an appropriate solvent and a palladium catalyst to afford the cross-coupled product. A preferred amino protecting group is bis (t-butoxycarbonyl). Preferred palladium catalysts include but are not limited to tris(dibenzylideneacetone)palladium, and mixtures of palladium on carbon, copper(I)iodide and triphenylarsenate and the like. A preferred solvent is N-methylpyrrolidinone. Upon isolation the product of step 2 may be further modified in a fashion directly analogous to those described in Scheme II. Alternatively in step 2 of Scheme V the double bond may be reduced by hydrogenation in the presence of a catalyst to afford the corresponding bicyclo[3.1.0]hexane. It is recognized that the particular conditions employed for this hydrogenation may differ depending on the exact compound desired but generally hydrogen pressures between 1-100 atmospheres will be applied at a temperature between 0°C and 10°C. An appropriate catalyst will be readily chosen by those skilled in the art, but may include palladium, ruthenium, or platinum on carbon. In turn the bicyclo[3.1.0]hexane obtained may be further modified by methods analogous to those described in Scheme II.

Scheme V

[0267] Scheme VI describes the preparation of further compounds of the present invention in which A contains a carbon atom. In step 1 of Scheme VI an appropriately protected 3-trifluoromethansulfonyl-6-hydroxymethyl-bicyclo[3.1.0]hexene is reacted with a suitably substituted 2-oxo-3-(4-trimethylstannylphenyl)-5-substituted oxazolidinone in the presence of an appropriate solvent and a palladium catalyst to afford the cross-coupled product. A preferred hydroxy protecting group is the t-butyldiphenylsilyl group. Preferred palladium catalysts include but are not limited to tris(dibenzylideneacetone)palladium, and mixtures of palladium on carbon, copper(I)iodide and triphenylarsenate and the like. A preferred solvent is N-methylpyrrolidinone. Upon isolation the product of step may be further modified in a fashion directly analogous to those described in Scheme IV. Alternatively in step 2 of Scheme VI the double bond may be reduced by hydrogenation in the presence of a catalyst to afford the corresponding bicyclo[3.1.0]hexane. It is recognized that the particular conditions employed for this hydrogenation may differ depending on the exact compound desired but generally hydrogen pressures between 1-100 atmospheres will be

applied at a temperature between 0°C and 100°C. An appropriate catalyst will be readily chosen by those skilled in the art, but may include palladium, ruthenium, or platinum on carbon. In turn the bicyclo[3.1.0]hexane obtained may be further modified by methods analogous to those described in Scheme IV.

### Antibacterial Activity

[0268] The pharmaceutically-acceptable compounds of the present invention are useful antibacterial agents having a good spectrum of activity in vitro against standard bacterial strains, which are used to screen for activity against pathogenic bacteria. Notably, the pharmaceutically-acceptable compounds of the present invention show activity against vancomycin-resistant enterococci, streptococci including penicillin-resistant *S. pneumoniae*, methicillin-resistant *S. aureus*, *M. catarrhalis*, and *C. pneumoniae*. The antibacterial spectrum and potency of a particular compound may be determined in a standard test system.

[0269] The following in vitro results were obtained based on an agar dilution method except for *C. pneumoniae*. The activity is presented as the minimum inhibitory concentration (MIC).

[0270] *S. aureus* and *M. catarrhalis* were tested on Mueller-Hinton agar, using an approximate inoculum of  $1 \times 10^4$  cfu/spot an incubation temperature of 35C for 24 hours. The MIC was defined as the lowest concentration at which no visible bacterial growth was observed.

[0271] Streptococci and enterococci were tested on Mueller-Hinton agar supplemented with 5 % defibrinated horse blood , using an approximate inoculum of  $1 \times 10^4$  cfu/spot an incubation temperature of 35°C in an atmosphere of 5% CO<sub>2</sub> for 24 hours. The MIC was defined as the lowest concentration at which no visible bacterial growth was observed.

[0272] *C. pneumoniae* was tested using minimum essential medium supplemented with 10% heat-inactivated fetal bovine serum, 2 mM L-glutamine, 1 mg/ml cycloheximide and non essential amino acid. HeLa 229 cells were inoculated with  $10^4$  inclusion-forming units of *C. pneumoniae* strain per mL. Infected cells were incubated with test compounds in complete medium at 35C in an atmosphere of 5% CO<sub>2</sub> for 72 hours. Cells monolayers were fixed in methanol, stained for chlamydial inclusions with an fluorescein-conjugated anti-Chlamydia monoclonal antibody, and were observed with fluorescence microscope. The MIC was defined as the lowest concentration at which no inclusion was observed.

[0273] The invention described herein is exemplified by the following non-limiting examples. The compound data is designated in accordance to *General Guidelines for Manuscript Preparation*, J. Org. Chem. Vol. 66, pg. 19A, Issue 1, 2001.

#### EXAMPLE 1

[0274] N-[5(S)-3-[4-[(1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-(N-Benzyl)amino-3-azabicyclo[3.1.0]hexan-3-yl]-3-fluorophenyl]-2-oxooxazolidin-5-ylmethyl]acetamide.

[0275] To a solution of N-[5(S)-3-[4-[(1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-(N-benzyl-N-t-butoxy carbonyl)amino-3-azabicyclo[3.1.0]hexan-3-yl]-3-fluorophenyl]-2-oxooxazolidin-5-ylmethyl]acetamide (3.02 g) in methanol (9 mL) was added a solution of hydrogen chloride in methanol (6 mL) at 0 °C, and the mixture was stirred at room temperature for 3 hours. After diluting the mixture by the addition of dichloromethane, the solution was made to alkaline by the addition of saturated sodium hydrogencarbonate solution. The

resulting mixture was extracted with dichloromethane. The organic extracts were dried over anhydrous sodium sulfate, filtered, and then concentrated in vacuo. Flash chromatography (silica, dichloromethane: methanol = 8:1) of the residue gave N-[5(S)-3-[4-[(1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-(N-benzyl)amino-3-azabicyclo[3.1.0]hexan-3-yl]-3-fluorophenyl]-2-oxooxazolidin-5-ylmethyl]acetamide (2.32 g).

Step 1.

[0974] 5(R)-3-[4-[(1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-(N-t-Butoxycarbonyl)amino-3-azabicyclo[3.1.0]hexan-3-yl]phenyl]-5-hydroxymethyloxazolidin-2-one.

[0975] To a solution of 4-[(1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-(N-t-butoxycarbonyl)amino-3-azabicyclo[3.1.0]hexan-3-yl]-1-benzyloxycarbonylaminobenzene (551 mg) in dry tetrahydrofuran (20 mL) was added a solution of t-butoxylithium in tetrahydrofuran (1.0 M, 2.0 mL) at room temperature, and the mixture was stirred for 15 min. (R)-Glycidyl butyrate (0.25 mL) was added to the mixture, the mixture was stirred at room temperature for 1 hour, and then at 50 °C for 3 hours. After quenching the reaction by the addition of methanol, the mixture was extracted with ethyl acetate. The organic extracts were washed with brine, dried over anhydrous magnesium sulfate, filtered, and then concentrated in vacuo. Treatment of the residue with ethyl acetate gave 5(R)-3-[4-[(1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-(N-t-butoxycarbonyl)amino-3-azabicyclo[3.1.0]hexan-3-yl]phenyl]-5-hydroxymethyloxazolidin-2-one (284 mg).

[01095] (1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-[(t-Butyl)diphenylsilyl]oxy]methyl-3-hydroxybicyclo[3.1.0]hexane Isomer A and B.

[01096] To a solution of (1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-[(t-butyl)diphenylsilyl]oxy]methylbicyclo[3.1.0]hex-2-ene (2.79 g) in tetrahydrofuran (28 mL) was added borane-methyl sulfide complex (927  $\mu$ L) at 0  $^\circ\text{C}$ , and the mixture was stirred at room temperature for 1.5 hours. The resulting solution was added water (22 mL), 2.5 N sodium hydroxide solution (4.8 mL), and hydrogen peroxide solution (30%, 1.36 mL) at 0  $^\circ\text{C}$ , and the mixture was stirred at room temperature for 1 hour. After dilution the mixture with water, the resulting mixture was extracted with ethyl acetate. The organic extracts were washed with brine, dried over anhydrous sodium sulfate, and then concentrated in vacuo. Flash chromatography (silica, hexane : ethyl acetate = 2:1) of the residue gave the two isomers of (1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-[(t-butyl)diphenylsilyl]oxy]methyl-3-hydroxybicyclo[3.1.0]hexane (2.38 g).

#### PREPARATIVE EXAMPLE 18

[01108] (1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-[(t-Butoxycarbonyl)amino]bicyclo[3.1.0]hex-2-ene.

[01109] To a solution of (1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-bicyclo[3.1.0]hex-2-en-6-carboxylic acid (1.52 g) in dichloromethane (30 mL) were added triethylamine (1.87 mL) and ethyl chloroformate (1.32 mL) at  $0^{\circ}\text{C}$ , the mixture was stirred at the same temperature for 10 minutes, and then concentrated in vacuo. After dilution the resulting residue with acetone (15 mL), a solution of sodium azide (1.59 g) in water (8 mL) was added at  $0^{\circ}\text{C}$ , and the mixture was stirred at the same temperature for 10 minutes. After dilution the mixture with ice water, the mixture was extracted with ethyl acetate. The organic extracts were washed with brine, dried over anhydrous sodium sulfate, and then concentrated in vacuo. The resulting residue was diluted with toluene (30 mL) and t-butanol (4.5 mL), the mixture was heated at reflux for 28 hours, and then concentrated in vacuo. Flash chromatography (silica, hexane : ethyl acetate = 10:3) of the residue gave (1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-[(t-butoxycarbonyl)amino]bicyclo[3.1.0]hex-2-ene (1.61 g).

[01132] Benzyl (1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-Acetyl-3-azabicyclo[3.1.0]hexan-3-ylcarboxylate.

##### Step 1.

[01133] Benzyl (1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-(1-hydroxy)ethyl-3-azabicyclo[3.1.0]hexan-3-ylcarboxylate.

[01134] To a solution of benzyl (1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-formyl-3-azabicyclo[3.1.0]hexan-3-ylcarboxylate (45 mg) in tetrahydrofuran (2 mL) was added methyl magnesiumbromide (3 M solution in diethylether, 122  $\mu$ L) at 0 °C, and the mixture was stirred at room temperature for 2 hours. After quenching the reaction by the addition of saturated ammonium chloride solution, the mixture was extracted with ethyl acetate. The organic extracts were washed with brine, dried over anhydrous magnesium sulfate, and then concentrated in vacuo to give benzyl (1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-(1-hydroxy)ethyl-3-azabicyclo[3.1.0]hexan-3-ylcarboxylate.

##### Step 2.

[01135] Benzyl (1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-acetyl-3-azabicyclo[3.1.0]hexan-3-ylcarboxylate

[01136] The title compound benzyl (1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-acetyl-3-azabicyclo[3.1.0]hexan-3-ylcarboxylate (34.0 mg) was prepared from the above crude benzyl (1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-(1-hydroxy)ethyl-3-azabicyclo[3.1.0]hexan-3-ylcarboxylate in the same manner as described for EXAMPLE 22.

[01139] Benzyl (1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-Hydroxy-3-azabicyclo[3.1.0]hexan-3-ylcarboxylate.  
Step 1.

[01140] Benzyl (1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-acetoxy-3-azabicyclo[3.1.0]hexan-3-ylcarboxylate.

[01141] To a solution of benzyl (1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-acetyl-3-azabicyclo[3.1.0]hexan-3-ylcarboxylate (23.0 mg) in dichloromethane (1 mL) was added urea-hydrogen peroxide complex (83.0 mg) and trifluoroacetic anhydride (100  $\mu$ L) at 0 °C, and the mixture was stirred at room temperature for 18 hours. After quenching the reaction by the addition of saturated sodium hydrogencarbonate solution and 5 % sodium thiosulfate solution, the mixture was extracted with dichloromethane. The organic extracts were dried over anhydrous magnesium sulfate, and then concentrated in vacuo to give benzyl (1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-acetoxy-3-azabicyclo[3.1.0]hexan-3-ylcarboxylate.

Step 2.

[01142] Benzyl (1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-hydroxy-3-azabicyclo[3.1.0]hexan-3-ylcarboxylate.

[01143] To a solution of the above crude benzyl (1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-acetoxy-3-azabicyclo[3.1.0]hexan-3-ylcarboxylate in methanol (2 mL) was added potassium carbonate (13.8 mg), and the mixture was stirred at room temperature for 10 min, and then concentrated in vacuo. After addition of water to the residue, the mixture was extracted with ethyl acetate. The organic extracts were washed with brine, dried over anhydrous magnesium sulfate, and then concentrated in vacuo. Flash chromatography (silica, hexane : ethyl acetate = 1:1) of the residue gave benzyl (1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-hydroxy-3-azabicyclo[3.1.0]hexan-3-ylcarboxylate (6.3 mg).

#### PREPARATIVE EXAMPLE 34

[01184] 5(R)-3-(3-Fluoro-4-iodophenyl)-5-hydroxymethyloxazolidin-2-one.

##### Step 1.

[01185] 5(R)-Acetoxymethyl-3-(3-fluorophenyl)oxazolidin-2-one.

[01186] To a solution of 5(R)-3-(3-fluorophenyl)-5-hydroxymethyloxazolidin-2-one (5.28 g) in tetrahydrofuran (53 mL) was added triethylamine (3.83 mL), acetic anhydride (2.55 mL) and (4-dimethylamino)pyridine (152 mg), and the mixture was stirred at room temperature for 1 hour. After quenching the reaction by the addition of 1 N hydrochloric acid, the mixture was extracted with ethyl acetate. The organic extracts were washed with brine, dried over anhydrous sodium sulfate, filtered, and then concentrated in vacuo to give crude 5(R)-acetoxymethyl-3-(3-fluorophenyl)oxazolidin-2-one (6.33 g).

Step 2.

[01187] 5(R)-Acetoxymethyl-3-(3-fluoro-4-iodophenyl)oxazolidin-2-one.

[01188] To a solution of 5(R)-acetoxymethyl-3-(3-fluorophenyl)oxazolidin-2-one (6.33 g) in acetic acid (40 mL) was added iodine monochloride (1.91 mL), the mixture was stirred at room temperature for 18 hours, and then concentrated in vacuo. The resulting residue was dissolved with ethyl acetate, the mixture was washed with aqueous sodium hydrogencarbonate solution, 20 % sodium sulfite solution and brine, dried over anhydrous sodium sulfate, filtered, and then concentrated in vacuo to give crude 5(R)-acetoxymethyl-3-(3-fluoro-4-iodophenyl)oxazolidin-2-one (9.48 g).

Step 3.

[01189] 5(R)-3-(3-Fluoro-4-iodophenyl)-5-hydroxymethyloxazolidin-2-one.

[01190] To a solution of crude 5(R)-acetoxymethyl-3-(3-fluoro-4-iodophenyl)oxazolidin-2-one (9.48 g) in methanol (95 mL) was added potassium carbonate (6.91 g), and the mixture was stirred at room temperature for 2.5 hours. After insoluble materials were filtered off, the filtrate was concentrated in vacuo. The residue was dissolved with ethyl acetate, the mixture was washed with brine, dried over anhydrous sodium sulfate, filtered, and then concentrated in vacuo. After treating of the residue with isopropanol, the resulting precipitates were collected by filtration to give 5(R)-3-(3-fluoro-4-iodophenyl)-5-hydroxymethyloxazolidin-2-one, and the filtrate was concentrated in vacuo. Flash chromatography (silica, ethyl acetate) of the residue gave further amount of the product (total 6.24 g).

[01258] (1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-hydroxymethyl-2-(4,4,5,5-tetramethyl-1,3,2-dioxaborolyl)bicyclo[3.1.0]hex-2-ene.

[01259] To a solution of (1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-[(t-butylidiphenylsilyl)oxy]methyl-2-(4,4,5,5-tetramethyl-1,3,2-dioxaborolyl)bicyclo[3.1.0]hex-2-ene (4.00 g) in methanol (50 mL) was added a solution of 2 M HCl in ether, the mixture was stirred at 60 °C for 20 min, and then concentrated in vacuo. The mixture of the above residue, anhydrous magnesium sulfate (10.10 g) and pinacol (1.99 g) in toluene (50 mL) was stirred at 80 °C for 30 min. After the insoluble materials were filtered off, the mixture was washed with water, dried over anhydrous magnesium sulfate, filtered, and then concentrated in vacuo.

Flash chromatography (silica, hexane : ethyl acetate = 2:1) of the residue gave (1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-hydroxymethyl-2-(4,4,5,5-tetramethyl-1,3,2-dioxaborolyl)bicyclo[3.1.0]hex-2-ene (1.40 g). Optical resolution of this compound was performed by HPLC using CHIRALPAK AS (hexane : 2-propanol = 50:1, RT= 24.2 min and 26.7 min).

## WHAT IS CLAIMED IS:

1. A compound of the following formula I:

its enantiomer, diastereomer, or pharmaceutically acceptable salt, hydrate or prodrug thereof wherein:

A represents C (when --- is present), CH, or N (when --- is not present);

--- represents a bond;

R represents hydrogen, or C<sub>1-6</sub> alkyl;

R<sub>1</sub> and R<sub>2</sub> independently represent

- i) hydrogen,
- ii) NR<sub>5</sub>R<sub>6</sub>,
- iii) CR<sub>7</sub>R<sub>8</sub>R<sub>9</sub>, C(R)<sub>2</sub>OR<sub>14</sub>, CH<sub>2</sub>NHR<sub>14</sub>,
- iv) C(=O)R<sub>13</sub>, C(=NOH)H, C(=NOR<sub>13</sub>)H, C(=NOR<sub>13</sub>)R<sub>13</sub>, C(=NOH)R<sub>13</sub>,  
C(=O)N(R<sub>13</sub>)<sub>2</sub>, C(=NOH)N(R<sub>13</sub>)<sub>2</sub>, NHC(=X<sub>1</sub>)N(R<sub>13</sub>)<sub>2</sub>, (C=NH)R<sub>7</sub>,  
N(R<sub>13</sub>)C(=X<sub>1</sub>)N(R<sub>13</sub>)<sub>2</sub>, COOR<sub>13</sub>, SO<sub>2</sub>R<sub>14</sub>, N(R<sub>13</sub>)SO<sub>2</sub>R<sub>14</sub>, N(R<sub>13</sub>)COR<sub>14</sub>, or (C<sub>1-6</sub>alkyl)CN, CN, CH=C(R)<sub>2</sub>, OH, C(=O)CHR<sub>13</sub>, C(=NR<sub>13</sub>)R<sub>13</sub>, NHC(=X<sub>1</sub>)R<sub>13</sub>;

v)

vi) C<sub>5-10</sub> heterocycle optionally substituted with 1-3 groups of R<sub>7</sub>, which may be attached through either a carbon or a heteroatom;

represents aryl or heteroaryl, heterocycle, heterocyclyl or heterocyclic,

R<sub>x</sub> represents hydrogen or C<sub>1-6</sub> alkyl;

R<sub>3</sub> represent

- i) NH(C=X<sub>2</sub>)R<sub>12</sub>,
- ii) NHSO<sub>2</sub>R<sub>14</sub>,
- iii) NH(CH<sub>2</sub>)<sub>0-4</sub>aryl,
- iv) NH(CH<sub>2</sub>)<sub>0-4</sub>heteroaryl,
- v) S(CH<sub>2</sub>)<sub>0-4</sub>aryl,
- vi) S(CH<sub>2</sub>)<sub>0-4</sub>heteroaryl,
- vii) O(CH<sub>2</sub>)<sub>0-4</sub>aryl, or
- viii) O(CH<sub>2</sub>)<sub>0-4</sub>heteroaryl;

R<sub>4</sub> and R<sub>4a</sub> independently represent

- i) hydrogen,
- ii) halogen,
- iii) C<sub>1-6</sub> alkoxy, or
- iv) C<sub>1-6</sub> alkyl

r and s independently are 1-3, with the provision that when  $(R_{4a})_s$  and  $(R_4)_r$  are attached to an Ar or HAr ring the sum of r and s is less than or equal to 4;

R<sub>5</sub> and R<sub>6</sub> independently represent

- i) hydrogen,
- ii) C<sub>1-6</sub> alkyl optionally substituted with 1-3 groups of halogen, CN, OH, C<sub>1-6</sub> alkoxy, amino, imino, hydroxyamino, alkoxyamino, C<sub>1-6</sub> acyloxy, C<sub>1-6</sub> alkylsulfenyl, C<sub>1-6</sub> alkylsulfinyl, C<sub>1-6</sub> alkylsulfonyl, aminosulfonyl, C<sub>1-6</sub> alkylaminosulfonyl, C<sub>1-6</sub> dialkylaminosulfonyl, 4-morpholinylsulfonyl, phenyl, pyridine, 5-isoxazolyl, ethylenyloxy, or ethynyl, said phenyl and pyridine optionally substituted with 1-3 halogen, CN, OH, CF<sub>3</sub>, C<sub>1-6</sub> alkyl or C<sub>1-6</sub> alkoxy;
- iii) C<sub>1-6</sub> acyl optionally substituted with 1-3 groups of halogen, OH, SH, C<sub>1-6</sub> alkoxy, naphthalenoxy, phenoxy, amino, C<sub>1-6</sub> acylamino, hydroxylamino, alkoxylamino, C<sub>1-6</sub> acyloxy, aralkyloxy, phenyl, pyridine, C<sub>1-6</sub> alkylcarbonyl, C<sub>1-6</sub> alkylamino, C<sub>1-6</sub> dialkylamino, C<sub>1-6</sub> hydroxyacyloxy, C<sub>1-6</sub> alkylsulfenyl, phthalimido, maleimido, succinimido, said phenoxy, phenyl and pyridine optionally substituted with 1-3 groups of halo, OH, CN, C<sub>1-6</sub> alkoxy, amino, C<sub>1-6</sub> acylamino, CF<sub>3</sub> or C<sub>1-6</sub> alkyl;
- iv) C<sub>1-6</sub> alkylsulfonyl optionally substituted with 1-3 groups of halogen, OH, C<sub>1-6</sub> alkoxy, amino, hydroxylamino, alkoxylamino, C<sub>1-6</sub> acyloxy, or phenyl; said phenyl optionally substituted with 1-3 groups of halo, OH, C<sub>1-6</sub> alkoxy, amino, C<sub>1-6</sub> acylamino, CF<sub>3</sub> or C<sub>1-6</sub> alkyl;
- v) arylsulfonyl optionally substituted with 1-3 of halogen, C<sub>1-6</sub> alkoxy, OH or C<sub>1-6</sub> alkyl;
- vi) C<sub>1-6</sub> alkoxy carbonyl optionally substituted with 1-3 of halogen, OH, C<sub>1-6</sub> alkoxy, C<sub>1-6</sub> acyloxy, or phenyl, said phenyl optionally substituted with 1-3 groups of halo, OH, C<sub>1-6</sub> alkoxy, amino, C<sub>1-6</sub> acylamino, CF<sub>3</sub> or C<sub>1-6</sub> alkyl;

- vii) aminocarbonyl, C1-6 alkylaminocarbonyl or C1-6 dialkylaminocarbonyl, said alkyl groups optionally substituted with 1-3 groups of halogen, OH, C1-6 alkoxy or phenyl
- viii) five to six membered heterocycles optionally substituted with 1-3 groups of halogen, OH, CN, amino, C1-6 acylamino, C1-6 alkylsulfonylamino, C1-6 alkoxycarbonylamino, C1-6 alkoxy, C1-6 acyloxy or C1-6 alkyl, said alkyl optionally substituted with 1-3 groups of halogen, or C1-6 alkoxy;
- ix) C3-6 cycloalkylcarbonyl optionally substituted with 1-3 groups of halogen, OH, C1-6 alkoxy or CN;
- x) benzoyl optionally substituted with 1-3 groups of halogen, OH, C1-6 alkoxy, C1-6 alkyl, CF<sub>3</sub>, C1-6 alkanoyl, amino or C1-6 acylamino;
- xi) pyrrolylcarbonyl optionally substituted with 1-3 of C1-6 alkyl;
- xii) C1-2 acyloxyacetyl where the acyl is optionally substituted with amino, C1-6 alkylamino, C1-6 dialkylamino, 4-morpholino, 4-aminophenyl, 4-(dialkylamino)phenyl, 4-(glycylamino)phenyl; or

R<sub>5</sub> and R<sub>6</sub> taken together with any intervening atoms can form a 3 to 7 membered heterocyclic ring containing 1-2 heteroatoms independently chosen from O, S, SO, SO<sub>2</sub>, N, or NR<sub>8</sub>;

R<sub>7</sub> represent

- i) hydrogen, halogen, OH, C1-6 alkoxy, C1-6 alkyl, alkenyl,
- ii) amino, C1-6 alkylamino, C1-6 dialkylamino, hydroxylamino or C1-2 alkoxyamino all of which can be optionally substituted on the nitrogen with C1-6 acyl, C1-6 alkylsulfonyl or C1-6 alkoxycarbonyl, said acyl and alkylsulfonyl optionally substituted with 1-2 of halogen or OH;

R<sub>8</sub> and R<sub>9</sub> independently represents

- i) H, CN,

- ii) C<sub>1-6</sub> alkyl optionally substituted with 1-3 halogen, CN, OH, C<sub>1-6</sub> alkoxy, C<sub>1-6</sub> acyloxy, or amino,
- iii) phenyl optionally substituted with 1-3 groups of halogen, OH, C<sub>1-6</sub> alkoxy; or

R<sub>7</sub> and R<sub>8</sub> taken together can form a 3-7 membered ring optionally interrupted with 1-2 heteroatoms chosen from O, S, SO, SO<sub>2</sub>, NH, and NR<sub>8</sub>;

X<sub>1</sub> represents O, S or NR<sub>13</sub>, NCN, or NSO<sub>2</sub>R<sub>14</sub>

X<sub>2</sub> represents O, S, NH or NSO<sub>2</sub>R<sub>14</sub>;

R<sub>10</sub> represents hydrogen, C<sub>1-6</sub> alkyl or CO<sub>2</sub>R<sub>15</sub>;

R<sub>11</sub> represents hydrogen, C<sub>1-6</sub> alkyl, C<sub>1-6</sub> alkanoyl, halogen, amino, C<sub>1-6</sub> acylamino, C<sub>1-6</sub> alkoxy, OH or CF<sub>3</sub>, ; NHC<sub>1-6</sub> alkyl, or N(C<sub>1-6</sub> alkyl)<sub>2</sub>, where said alkyl may be substituted with 1-3 groups of halo, OH or C<sub>1-6</sub> alkoxy;

R<sub>12</sub> represents hydrogen, C<sub>1-6</sub> alkyl, NH<sub>2</sub>, C<sub>1-6</sub> alkylamino, C<sub>1-6</sub> alkoxy or C<sub>1-6</sub> dialkylamino, where said alkyl may be substituted with 1-3 groups of halo, OH or C<sub>1-6</sub> alkoxy;

Each R<sub>13</sub> represents independently hydrogen, C<sub>1-6</sub> alkyl, NR<sub>5</sub>R<sub>6</sub>, SR<sub>8</sub>, S(O)R<sub>8</sub>, S(O)R<sub>8</sub>, CN, C<sub>1-6</sub> alkylS(O)R, C<sub>1-6</sub> alkoxy carbonyl, hydroxycarbonyl, C<sub>1-6</sub> acyl,

C<sub>3-7</sub> membered carbon ring optionally interrupted with 1-4 heteroatoms chosen from O, S, SO, SO<sub>2</sub>, NH and NR<sub>8</sub> where said C<sub>1-6</sub> alkyl or C<sub>1-6</sub> acyl groups may be independently substituted with 0-3 halogens, hydroxy, N(R)<sub>2</sub>, CO<sub>2</sub>R, C<sub>6-10</sub>aryl, C<sub>5-10</sub>heteroaryl, or C<sub>1-6</sub>alkoxy groups;

When two  $R_{13}$  groups are attached to the same atom or two adjacent atoms they may be taken together to form a 3-7 membered ring optionally interrupted with 1-2 heteroatoms chosen from O, S, SO,  $SO_2$ , NH, and  $NR_8$ ;

$R_{14}$  represents amino,  $C_{1-6}$  alkyl,  $C_{1-6}$  haloalkyl, five to six membered heterocycles or phenyl, said phenyl and heterocycles optionally substituted with 1-3 group of halo,  $C_{1-6}$  alkoxy,  $C_{1-6}$  acylamino, or  $C_{1-6}$  alkyl, hydroxy and/or amino, said amino and hydroxy optionally protected with an amino or hydroxy protecting group;

$R_{15}$  is  $C_{1-6}$  alkyl or benzyl said benzyl optionally substituted with 1-3 groups of halo, OH,  $C_{1-6}$  alkoxy, amino,  $C_{1-6}$  acylamino, or  $C_{1-6}$  alkyl; and

m, n, and q represents 0-1.

2. A compound according to claim 1 wherein A is CH.
3. A compound according to claim 1 wherein A is C and --- is present.
4. A compound according to claim 1 wherein A is N.
5. A compound according to claim 1 wherein  $R_1$  and  $R_2$  independently represent H,  $NR_5R_6$ , CN, OH,  $C(R)_2OR_{14}$ ,  $NHC(=X_1)N(R_{13})_2$ ,  $C(=NOH)N(R_{13})_2$ , or  $CR_7R_8R_9$ .
6. A compound according to claim 1 wherein  is phenyl, pyridine, pyrimidine, or piperidine.
7. A compound according to claim 5 wherein one of  $R_1$  and  $R_2$  is H and the other is  $NR_5R_6$ .

8. A compound according to claim 5 wherein one of R<sub>1</sub> and R<sub>2</sub> is H and the other is CN.

9. A compound according to claim 1 wherein R<sub>5</sub> and R<sub>6</sub> independently are:

- i) hydrogen,
- ii) C<sub>1-6</sub> alkyl optionally substituted with 1-3 groups of halogen, CN, OH, C<sub>1-6</sub> alkoxy, amino, imino, hydroxyamino, alkoxyamino, C<sub>1-6</sub> acyloxy, C<sub>1-6</sub> alkylsulfenyl, C<sub>1-6</sub> alkylsulfinyl, C<sub>1-6</sub> alkylsulfonyl, aminosulfonyl, C<sub>1-6</sub> alkylaminosulfonyl, C<sub>1-6</sub> dialkylaminosulfonyl, 4-morpholinylsulfonyl, phenyl, pyridine, 5-isoxazolyl, ethylenyloxy, or ethynyl, said phenyl and pyridine optionally substituted with 1-3 halogen, CN, OH, CF<sub>3</sub>, C<sub>1-6</sub> alkyl or C<sub>1-6</sub> alkoxy;
- iii) C<sub>1-6</sub> acyl optionally substituted with 1-3 groups of halogen, OH, SH, C<sub>1-6</sub> alkoxy, naphthalenoxy, phenoxy, amino, C<sub>1-6</sub> acylamino, hydroxylamino, alkoxyamino, C<sub>1-6</sub> acyloxy, aralkyloxy, phenyl, pyridine, C<sub>1-6</sub> alkylcarbonyl, C<sub>1-6</sub> alkylamino, C<sub>1-6</sub> dialkylamino, C<sub>1-6</sub> hydroxyacyloxy, C<sub>1-6</sub> alkylsulfenyl, phthalimido, maleimido, succinimido, said phenoxy, phenyl and pyridine optionally substituted with 1-3 groups of halo, OH, CN, C<sub>1-6</sub> alkoxy, amino, C<sub>1-6</sub> acylamino, CF<sub>3</sub> or C<sub>1-6</sub> alkyl;
- iv) benzoyl optionally substituted with 1-3 groups of halogen, OH, C<sub>1-6</sub> alkoxy, C<sub>1-6</sub> alkyl, CF<sub>3</sub>, C<sub>1-6</sub> alkanoyl, amino or C<sub>1-6</sub> acylamino.

10. A compound according to claim 1 wherein X<sub>1</sub> represents O.

11. A compound according to claim 1 wherein one of R<sub>1</sub> or R<sub>2</sub> is hydrogen and the other is:

wherein  $R_{10}$ ,  $X_1$ ,  $m$ ,  $q$ , and  $R_{11}$  are as described in claim 1.

12. A compound according to claim 1, of the structural formula II:

wherein  $R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$ ,  $R_{4a}$ , and  $R_x$  are as described in claim 1 and  $A$  is  $N$ .

13. A compound according to claim 12 wherein  $R_1$  and  $R_2$  independently represent  $H$ ,  $NR_5R_6$ ,  $CN$ ,  $OH$ ,  $C(R)_2OR_{14}$ ,  $NHC(=X_1)N(R_{13})_2$ ,  $C(=NOH)N(R_{13})_2$ , or

is phenyl, pyridine, pyrimidine, or piperidine.

14. A compound according to claim 13 wherein one of  $R_1$  and  $R_2$  is  $H$  and the other is  $NR_5R_6$ .

15. A compound according to claim 13 wherein one of  $R_1$  and  $R_2$  is  $H$  and the other is  $CN$ .

16. A compound according to claim 1 of the structural formula II:

wherein  $R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$ ,  $R_{4a}$ , and  $R_x$  are as described herein and A is C wherein --- is present.

17. A compound according to claim 16 wherein  $R_1$  and  $R_2$  independently represent H,  $NR_5R_6$ , CN, OH,  $C(R)_2OR_{14}$ ,  $NHC(=X_1)N(R_{13})_2$ ,  $C(=NOH)N(R_{13})_2$ , or

$CR_7R_8R_9$  and  $\begin{array}{c} \text{Ar} \\ \text{or} \\ \text{HAr} \end{array}$  is phenyl, pyridine, pyrimidine, or piperidine.

18. A compound according to claim 17 wherein one of  $R_1$  and  $R_2$  is H and the other is  $NR_5R_6$ .

19. A compound according to claim 17 wherein one of  $R_1$  and  $R_2$  is H and the other is CN.

20. A compound according to claim 1 of the structural formula IIIa or IIIb:

wherein  $R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$ ,  $R_{4a}$ , and  $R_x$  are as described herein and A is N.

21. A compound according to claim 20 wherein  $R_1$  and  $R_2$  independently represent H,  $NR_5R_6$ , CN, OH,  $C(R)_2OR_{14}$ ,  $NHC(=X1)N(R_{13})_2$ ,  $C(=NOH)N(R_{13})_2$ , or

$CR_7R_8R_9$  and  $\begin{array}{c} \text{Ar} \\ \text{or} \\ \text{HAr} \end{array}$  is phenyl, pyridine, pyrimidine, or piperidine.

22. A compound according to claim 21 wherein one of  $R_1$  and  $R_2$  is H and the other is  $NR_5R_6$ .

23. A compound according to claim 21 wherein one of  $R_1$  and  $R_2$  is H and the other is CN.

24. A compound according to claim 1 of the structural formula IIIa or IIIb:

wherein  $R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$ ,  $R_{4a}$ , and  $R_x$  are as described herein and A is C wherein --- is present.

25. A compound according to claim 24 wherein  $R_1$  and  $R_2$  independently represent H,  $NR_5R_6$ , CN, OH,  $C(R)_2OR_{14}$ ,  $NHC(=X1)N(R_{13})_2$ ,  $C(=NOH)N(R_{13})_2$ , or

$CR_7R_8R_9$  and  $\begin{array}{c} \text{Ar} \\ \text{or} \\ \text{HAr} \end{array}$  is phenyl, pyridine, pyrimidine, or piperidine.

26. A compound according to claim 25 wherein one of R<sub>1</sub> and R<sub>2</sub> is H and the other is NR<sub>5</sub>R<sub>6</sub>.

27. A compound according to claim 25 wherein one of R<sub>1</sub> and R<sub>2</sub> is H and the other is CN.

28. A compound which is:

N-[5(S)-3-[4-[(1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-(N-Benzyl)amino-3-azabicyclo[3.1.0]hexan-3-yl]-3-fluorophenyl]-2-oxooxazolidin-5-ylmethyl]acetamide,

N-[5(S)-3-[4-[(1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-(N-Benzyl)oxyacetyl]amino-3-azabicyclo[3.1.0]hexan-3-yl]-3-fluorophenyl]-2-oxooxazolidin-5-ylmethyl]acetamide,

N-[5(S)-3-[3-Fluoro-4-[(1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-(N-hydroxyacetyl)amino-3-azabicyclo[3.1.0]hexan-3-yl]phenyl]-2-oxooxazolidin-5-ylmethyl]acetamide,

N-[5(S)-3-[4-[(1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-(N-Benzyl-N-methyl)amino-3-azabicyclo[3.1.0]hexan-3-yl]-3-fluorophenyl]-2-oxooxazolidin-5-ylmethyl]acetamide,

N-[5(S)-3-[3-Fluoro-4-[(1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-(N-methyl)amino-3-azabicyclo[3.1.0]hexan-3-yl]phenyl]-2-oxooxazolidin-5-ylmethyl]acetamide,

N-[5(S)-3-[4-[(1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-(N-Benzyl)oxyacetyl-N-methyl]amino-3-azabicyclo[3.1.0]hexan-3-yl]-3-fluorophenyl]-2-oxooxazolidin-5-ylmethyl]acetamide,

32. A pharmaceutical composition comprised of a compound in accordance with claim 1 in combination with a pharmaceutically acceptable carrier.

32. A pharmaceutical composition comprised of a compound in accordance with claim 1 in combination with a pharmaceutically acceptable carrier.

33. A pharmaceutical composition produced by combining a compound in accordance with claim 1 with a pharmaceutically acceptable carrier.

34. A method of treating or preventing a bacterial infection in a mammalian patient in need thereof, comprising administering to said patient an effective amount of a compound of claim 1.

35. A method for the preparation of a compound of claim 1, wherein A is a nitrogen atom and the 3-azabicyclo[3.1.0]hexane has a 6-amino substituent, the method comprising:

1) reacting a 6-amino-3-azabicyclo[3.1.0]hexane having a protected 6-amino substituent with an aryl or heteroaryl compound bearing a nitro group and a leaving group;

2) reducing the product from step 1) to the corresponding amino compound, and protecting the resulting amino group;

3) reacting the protected amino aryl or heteroaryl product from step 2) with a strong base and then condensing with a glycidyl ester to form a 5-hydroxymethyloxazolidinone as a product;

4) converting the 5-hydroxymethyloxaxolidinone from step 3) to a 5-aminomethyloxazolidinone by first converting the hydroxy group to an activated leaving group, displacing the leaving group with sodium azide, and then reducing the resulting 5-azidooxazolidinone to the amine; and

5) acylating the 5-aminooxazolidinone from step 4) and converting the amino substituent to R<sub>3</sub>.

36. A method according to claim 35, wherein the product from step 5) is further subjected to reductive alkylation, alkylation, or acylation.

37. A method according to claim 35, wherein the protected amino aryl or heteroaryl product from step 2), after reaction with a strong base, is reacted with a racemic glycidyl ester to prepare a racemic oxazolidinone.

38. A method according to claim 37, wherein the protected amino aryl or heteroaryl product from step 2), after reaction with a strong base, is reacted with a chiral glycidyl ester to prepare chiral oxazolidinone.

39. A method according to claim 38, wherein the chiral glycidylester is an R-glycidylester.

40. A method according to claim 38, wherein the chiral glycidylester is an S-glycidylester.

41. A method for the preparation of a compound of claim 1, wherein A is a nitrogen atom and the 3-azabicyclo[3.1.0]hexane has a 6-carbon substituent, the method comprising:

1) reacting a 6-amino-3-azabicyclo[3.1.0]hexane having a protected 6-hydroxyl or 6-alkyl substituent with an aryl or heteroaryl compound bearing a nitro group and a leaving group;

2) reducing the product from step 1) to the corresponding amino compound, and protecting the resulting amino group;

3) reacting the protected amino aryl or heteroaryl product from step 2) with a strong base and then condensing with a glycidyl ester to form a 5-hydroxymethyloxazolidinone as a product;

4) converting the 5-hydroxymethyloxazolidinone from step 3) to a 5-aminomethyloxazolidinone by first converting the hydroxy group to an activated leaving group, displacing the leaving group with sodium azide, and then reducing the resulting 5-azidooxazolidinone to the amine; and

5) acylating the 5-aminooxazolidinone from step 4) and converting the amino substituent to R<sub>3</sub>.

42. A method according to claim 41, wherein the protected aminoaryl or heteroaryl product from step 2), after reaction with a strong base, is reacted with a racemic glycidyl ester to prepare a racemic oxazolidinone.

43. A method according to claim 41, wherein the protected aminoaryl or heteroaryl product from step 2), after reaction with strong base, is reacted with a chiral glycidyl ester to prepare a chiral oxazolidinone.

44. A method according to claim 43, wherein the chiral glycidylester is an R-glycidylester.

45. A method according to claim 43, wherein the chiral glycidylester is an S-glycidylester.

46. A method for preparation of a compound of claim 1, wherein the 3-azabicyclo[3.1.0] hexane has a protected hydroxyl group in the 6-position, the method comprising:

- 1) removing the protecting group to provide the free hydroxyl group;
- 2) activating the hydroxy group displacement with a nucleophilic substituent by converting the hydroxyl group to a leaving group; and
- 3) reacting the product from step 2) to replace the leaving group with a nucleophilic group.

47. A method for preparation of a compound of claim 1, wherein the 3-azabicyclo-[3.1.0]hexane has a protected hydroxyl group in the 6-position, the method comprising:

- 1) removing the protecting group to provide the free hydroxyl group;
- 2) oxidizing the hydroxyl group to the aldehyde;
- 3) further oxidizing the aldehyde group to the carboxylic acid; and
- 4) converting the carboxylic acid to a leaving group and treating with a nucleophile to introduce a nucleophilic group into the 6-position.

48. A method for the preparation of a compound of claim 1, wherein A contains a carbon atom and the 3-azabicyclo[3.1.0]hexane has a 6-amino substituent, the method comprising:

- 1) reacting a protected 3-trifluoromethanesulfonyl-6-amino-bicyclo[3.1.0]hexene with a substituted 2-oxo-3-(4-trimethylstannylphenyl)-5-substituted oxazolidinone to produce a cross-coupled product; and
- 2) reducing the double bond by hydrogenation to produce the bicyclo[3.1.0]hexane.
